

Individual Contribution Journal — Module 2 Lab Exercise

Jonathon Wilturner | ITAI 1371

I completed this lab on my own, from start to finish. I ran every code cell myself, working through each part in order rather than skipping ahead, checking that the output made sense before moving to the next section. That included loading and exploring the Iris dataset, building the scatter plot and the bar chart, and running both assessment tasks in the notebook.

I also wrote the analysis section in the notebook myself. That meant looking at the scatter plot and writing my own observations about what it showed, like Setosa forming a clear separate group and Versicolor and Virginica overlapping in the middle. I wrote the reflection notes based on what I actually saw in the data, not from a template or someone else's notes.

This lab took me roughly 15 hours total. A good part of that time went into getting past the confusion I hit early on, mainly understanding what the graphs and output were actually telling me, not just getting the code to run without errors. I didn't move on from a section until I understood it, which is why it took longer than it might for someone who just wanted the notebook finished.

No one else worked on my copy of this lab with me. Everything submitted under my name, the executed code, the written analysis, and the reflection, is my own work.
